

EvenUp Onboarding Playbook — Training Module Script

"From Medical Records to Case Insight: Reviewing a MedChron for PI Case Development"

Format: Self-paced module, built in Articulate Rise **Audience:** Medical paralegals and senior case managers at a personal-injury firm (the MedChron pilot cohort) **Length:** ~20–25 minutes · three chapters **Goal:** Move the paralegal from manual extraction toward verification, gap-spotting, and case-story development — and build the habit that earns attorney trust: review the chronology against the source.

Independent work sample built from EvenUp's public materials. Not affiliated with or endorsed by EvenUp. Set at a fictional firm (Lakefront Injury Group). Product names (MedChron, Demands, Piai, etc.) are used descriptively.

How to use this script with Articulate Rise's AI assistant

Paste one chapter at a time into Rise's AI course/block builder. Each chapter gives you the **learning objective**, the **on-screen blocks** (with the Rise block type in [brackets]), the **copy** to drop in, and **answer-keyed knowledge checks**. Set the Rise theme to a light background, deep slate-navy headings, and a single periwinkle accent so the module matches the rest of the playbook.

This module is deliberately narrow. It does not teach the whole product — it teaches one role one workflow where it meets one EvenUp product, the MedChron. That is what real adoption looks like.

INTRO — Why this module exists

[Cover / statement block] Headline: *The goal isn't to replace your judgment. It's to free it.* Subhead: MedChron takes on the manual extraction so you can spend your time on verification, gap-spotting, and the medical story that drives the case.

[Text block] In active litigation, medical records become overwhelming fast. The MedChron turns thousands of pages into a searchable treatment timeline with diagnostic

highlights and direct exhibit links. But a chronology only helps if the team trusts it — and trust is earned through verification, not assumed. This module walks the one workflow that earns it: knowing when a case is ready, how to review the chronology against the source, and how to turn what you find into action.

[Knowledge check — multiple choice] Q: What is the paralegal's role once a MedChron is generated? - A) Accept the output and move on to save time - B) Re-type the records by hand to be safe - C) Verify the chronology against source, spot gaps, and develop the case story ☐ - D) Hand it to the attorney without review Feedback (correct): The value moves from extraction to verification and judgment — exactly where a paralegal's expertise matters most.

CHAPTER 1 — When a case is ready for a MedChron

[Statement block] *Learning objective:* Identify when a matter is ready for a MedChron and prepare a complete, usable source packet.

[Text block] A MedChron is only as good as the packet it's built from. The question isn't "who should use MedChrons?" — it's "*at what moment in this case would a verified, searchable chronology change what someone does next?*" For most matters that's shortly after records are collected and before demand strategy, treatment-gap follow-up, or attorney case review.

[Process block] — Readiness checklist 1. Medical records collected for the treatment window 2. Bills present and matched to providers 3. Provider list verified (names, facilities, dates) 4. Treatment date range confirmed; obvious gaps noted 5. Correct matter selected; files named to the firm's convention

[Text block] At Lakefront Injury Group, the pilot starts with standard motor-vehicle and premises matters that meet these criteria — and holds back catastrophic or heavily fragmented files until the workflow is trusted.

[Knowledge check — scenario] Q: Records are in, but two providers from the police report and intake aren't in the file yet. Is the matter ready to submit? - A) Yes — submit and add the rest later - B) No — complete the provider set first, or flag the known gap before submitting ☐ - C) Yes — the AI will find them Feedback (correct): Submitting an incomplete packet produces an incomplete chronology. Complete the set, or flag the gap so it's tracked, not missed.

CHAPTER 2 — How to review a MedChron

[Statement block] *Learning objective:* Use the chronology to validate key medical events, identify missing information, and verify the story of treatment against the source.

[Text block] Reviewing isn't re-reading every page — it's spot-checking the chain at the points that matter most, using the timeline, filters, and exhibit links.

[Accordion or numbered list block] — the review pass 1. **Orient on the timeline.** Scan the arc of treatment — onset, key diagnoses, procedures, provider sequence, and the end of care. 2. **Verify the high-stakes facts.** Click the citations on the injury, the major diagnoses, and the largest bills. Each should land on the record that supports it. 3. **Filter and cross-check.** Filter by date or provider; compare the chronology's visit count and providers against the records you have. 4. **Hunt for gaps.** Treatment gaps, missing records, and pre-existing conditions an adjuster or defense will attack — surface them, don't bury them. 5. **Spot discrepancies.** Transposed dates, merged encounters, "resolved" vs. "ongoing," a minor note read as a major finding. Verify severity language against the physician's own words.

[Flashcard grid block] — catch these - **Transposed/wrong dates** → spot-check dates on key events; watch month/day flips. - **Merged encounters** → compare visit count to the records for that provider. - **Missing records** → check the provider list against intake and the bills. - **Mischaracterized severity** → verify against the physician's wording. - **Broken citation** → if the linked page doesn't say it, fix it.

[Knowledge check — multiple response] Q: Which belong in the review pass? (Select all) - Verify high-stakes facts against citations ☐ - Filter and cross-check visit counts ☐ - Re-type the records by hand ☐ - Surface treatment gaps and pre-existing conditions ☐ - Verify severity language against the source ☐ Feedback: Verify smartly at the highest-stakes points — don't redo the work by hand.

CHAPTER 3 — Turning chronology findings into action

[Statement block] *Learning objective:* Translate chronology findings into concrete case-management and attorney-review actions.

[Text block] A chronology isn't a static deliverable — it's a to-do list for the case. Every gap and discrepancy you found becomes an action with an owner.

[Numbered list block] — from finding to action 1. **Missing records** → open a records

request; log it for the case manager to track. 2. **Treatment gaps** → flag for client/provider follow-up before they cost case value. 3. **Pre-existing conditions or causation questions** → escalate to the attorney; these can affect case theory and damages. 4. **Attorney case-review prep** → note the questions the chronology helps answer (severity, timeline, valuation). 5. **Document it** → record findings in the firm's existing system so nothing lives only in someone's head.

[Statement block]

Escalate anything that could affect causation, damages, or case theory. That judgment is the human work the tool exists to support — not replace.

[Knowledge check — scenario] Q: The chronology shows a six-week gap between the ER visit and the first follow-up, and a prior back injury noted once. What do you do? - A) Nothing — it's in the chronology - B) Flag the treatment gap for follow-up and escalate the pre-existing condition to the attorney ☐ - C) Delete the prior-injury note so it doesn't hurt the case - D) Wait for the attorney to notice Feedback (correct): Surface and route both. Gaps and pre-existing conditions are exactly what the defense will probe — better caught now, by you.

CLOSE — wrap, job aid, final check

[Text block] You now own the workflow that earns trust in AI output: know when a case is ready, review the chronology against the source, and turn what you find into action. Fast and trusted — that's what good looks like, and it's how the firm gets the full value of EvenUp.

[Download / file block] Attach the one-page **MedChron Review job aid** (below).

[Final knowledge check — multiple choice] Q: What's the through-line of this module? - A) Trust the AI completely to save time - B) Re-do the AI's work manually - C) Verify against source, spot gaps, and turn findings into action ☐ - D) Only use MedChron on small cases Feedback (correct): Verify, spot, act — the habit that makes adoption stick.

[Closing statement block] Headline: *From records to case insight*. Subhead: Less extraction, more judgment — and a chronology the whole team can trust.

One-page job aid (attach in the Close)

MedChron Review — ready · review · act 1. **Ready?** Records, bills, provider list,

treatment window, correct matter, named files. 2. **Review:** orient on the timeline → verify high-stakes facts via citations → filter & cross-check → hunt gaps → spot discrepancies. 3. **Act:** records requests, treatment-gap follow-up, escalate causation/pre-existing issues, prep attorney review, document in the firm system. *When in doubt, click the citation. If the page doesn't say it, fix it before it ships.*
